

Mavin Technologies Releases Mavin Security Management Platform Version 5.2

Latest version of security platform features automatic client workstation installation capability.

Rochester, NY – August 2, 2017 – Mavin Technologies, a Rochester NY based service oriented provider of physical access control solutions, today announced the general availability of its Mavin Security Management Platform version 5.2.

The highlight of Mavin SMP 5.2 is the ability to deploy automatic client workstation upgrades from a central location.

“Having the capability to automatically install system upgrades to client workstations significantly decreases the amount of time required to deploy a new version of software” explained Jeff Ross, Managing Director at Mavin Technologies, “in addition, there are tremendous costs savings enjoyed when technicians are not required to physically visit each client every time a new version of software is released.”

When enabled, the automated installation works by having the client workstation verify its current version against the version installed on the database server. If the client is behind, it automatically downloads and installs the latest version. It’s a quick and seamless process to the system user.

Mavin SMP 5.2 also offers the ability to automatically delete old database backups, a feature that maximizes efficiency of storage space. Mavin SMP 5.2 also supports an updated system integration to the FLIR/DVTeL Latitude 7.0 video management system. In addition, new script reports and people related report filters have been implemented in this latest release.

Mavin Technologies is currently building an elite network of authorized system integrators and value added resellers to deliver reliable, affordable Mavin products and services to customers of all sizes and industries.

About Mavin Technologies

Mavin Technologies delivers smart, simple, and secure access control solutions designed to maximize reliability, drive optimum performance, and simplify administration & operator tasks. Mavin makes it easy for companies to gather existing security functions together into one seamless access management system by integrating best of breed hardware and software.
